

How It Works

1 The system coordinates with contractors to track every item entering the home. Such items include appliances, electronics, security system, and other unique installs at the time of build.

2 Model numbers are recorded to automatically retrieve and store item information through APIs.

3 Buyers will be able to study all the options from the comfort of their existing home while making better decisions about options, finishes, and models.

Users can easily experiment with changes to the home, such as adding options, at their convenience. As the system is integrated with product information, it shows, in real time, the actual costs of making changes, time required, and the full functionality of all the options.

4 CasaCommand will condense the home buying experience from several weeks to a matter of days. No scheduling hassles, complete transparency, and turn-key delivery with ongoing support.

Be the first to utilize our unique mapping and tagging system and manage your homes your way.
